At the source

An opportunity to visit the factory that makes Eurogrip tyres gave RISHAAD MODY an insight into how the indian-made tyre scene is taking big leaps forward.

PHOTOGRAPHY: JACQUES AUBREY, SAKET KADU, EUROGrip

“Every tyre is fully traceable, down to when it was made and by which machine.”

to help them keep the desired shape until the rubber cools. The duration of this final process can take anything from 10-20 minutes, depending on the model. Every tyre made has a bar code that makes it fully traceable, down to where it was made, using what batch of material, by which machine, and even by which worker.

With the manufacturing side covered, we then got to witness the R&D labs. This was split into three separate labs – chemical, material and analytical. Here, the company has a fully forensic setup whereby they can tell you the complete breakdown of the materials in a tyre – practically down to the molecular level. This level of insight is a crucial when it comes to testing and developing new materials, vendor development and, of course, evaluating products from the competition.

The company revealed that 95 percent of the two-wheeler tyres it rolls out are now tubelless. It is also quite proud of the fact that up to 85 percent of the energy used to make these tyres is green and comes from rooftop solar as well as contracted windfarms in the locality. They also claim that there is zero water discharge, and all used water is treated and re-used.

This factory visit was a great way to understand where our tyre comes from, and I was surprised by how much of the rubber compound-making process is done in-house. It's good to see what a deep technological insight companies like this now have, and it means that we can only look forward to even better things to come.

There are a few components on an automobile that get previous little thought and attention while simultaneously playing such a big role as tyres. Tyres are some of the most valuable yet underappreciated aspects of riding a bike. Indian-made two-wheeler tyres have taken huge leaps forward in the past few years when it comes to performance, and TVS Drishikara has been one of the manufacturers leading that charge with its Eurogrip brand. While we've already had a few opportunities to sample their impressive new offerings, the company recently extended a unique opportunity to visit their tyre manufacturing facility in Madurai.

The tour began with a visit to the raw materials stocking warehouse, which provided a glimpse at the scale of the operation. This was a big warehouse packed with the very base-level materials that go into making a tyre – or, rather, the particular rubber compounds that make the tyre.

The next stop was visiting the section where a concoction of chemicals like acids, resins, rubber and carbon black is cooked in pressure to produce the compounds that eventually make the tyre. This section of the facility was hotter, noisier and dustier than your typical auto factory, and there was a heavy lingering smell of chemicals in the air.

Different tyres in the Eurogrip range use different compounds, all of which are made in this section of the factory in the form of large black sheets of rubber. These sheets are then stacked in a storage section, with information tags about the traceability of their materials and what their expiry date is. Each batch is sample-tested and moves to the next stage of actually making the tyre only if it passes these tests.

At this point, we moved to sections of the plant that are more along the lines of what you would expect from an automobile factory, and one of them was even air conditioned. As it turns out, this wasn't simply for comfort, but because this was where the radial tyres were being prepared for the final process of being squeezed and baked into shape. The air conditioning is necessary to prevent the metal wires that go into the radial tyres from moisture in the air.

It was quite fascinating watching the rubber sheets slowly transform into the familiar shape of a tyre as they moved from machine to machine. Eventually, this led to a bald rubber hoop that was finally starting to look something like a tyre. However, the most impressive visual spectacle of all was the final stage, where this hoop is put into a mechanical press.

This machine generates about 180-200PSI of pressure and 120 degrees centigrade of heat. It's basically a giant pressure cooker that combines all the various polymers and compounds in the rubber in the desired manner. While doing so, it also gives the tyre its final shape in terms of tread pattern, profile and various stampings.

After some time, the super hot tyre was removed where ready and inflated with air.

We also got to experience a drive on Eurogrip tyre models on a ride to the local market. They proved themselves on both wet and dry roads.

Eurogrip to launch superbike tyre in India in 2027

This new superbike tyre from Eurogrip will compete with the Pirelli Supercorsa SP V4.

Published On Aug 22, 2025 02:29:00 PM

TVS's subsidiary Eurogrip, which manufactures a huge line of tyres for diverse use cases, has recently announced that it is working on a superbike tyre to rival the likes of the Pirelli Supercorsa SP V4 that is slated to hit the market in 2027.

19- Sep- 2025	OverDrive	Eurogrip Treadtalks: Madurai to Kodaikanal	92-95	Online

There's something oddly satisfying about watching raw rubber turn into a full-fledged motorcycle tyre – a transformation that takes place through a series of complex, almost hypnotic processes. And the clockwork, Eurogrip once again gives us a front-row seat to it all. Our journey started with an insightful factory tour near Madurai, where the mixing of rubber compounds, intricate weaving techniques, and rigorous testing regimes reminded us why tyre development is equal parts science and art. And it's great to see an Indian manufacturer go through such extreme lengths of testing to get it right. Eurogrip also informed us that they have set up shops in north America and are entering the sport-tourer/radial segment of India, have forged an alliance with BMW Motorrad for the 1200 and will soon enter the superbike segment in India (we sense a 1200/16i Poell Superbike road in the cards).

This wasn't my first time walking the factory floors with Eurogrip, but each visit still manages to bring something new to the table. It's always fascinating to see how multiple compounds are combined and tested, both mechanically and manually, to ensure each tyre meets a very high standard of durability, grip, and ride comfort. And once the behind-the-scenes lessons were done, it was time to hit the road – the real test bed.

This time, Eurogrip had us heading up from Madurai to the lush, winding heights of Kodaikanal. A brilliant ride, as always, and the perfect setting to put a new set of tyres through the paces. This time around, I'd chosen the Glorix 1200 with an ATT (Anti-Traction Transfer) Proton Extreme rear tyre on the way up to Kodaikanal, and hoped on a firm Xtrime 1200 for the descent with Eurogrip's Dualwall E80. Front and ATT rear tyres on. There were a variety of small to medium-capacity concrete and sport concrete hills to pick from, and even a couple of steep inclines in the line-up on this trip.

Now, the road itself was quite the journey. Starting off from Madurai's dry plains, we maneuvered through stretches of straight, well-paved tar roads, village roads lined with peaches and lychees, and finally, those beautifully twisty mountain roads that make you want to ride on forever. With every kilometre, the topography – and more importantly, the weather – changed. From sun-baked heat to mild mist

air as we neared Kodaikanal, the tyres had to adapt just as quickly as we did.

Eurogrip has always been quite clear about how they prefer to have their tyres tested – not in the real world, rather than confined to artificial test simulations. So it's their real-world offerings, their methods, and measures we get to push these products in environments where actual buyers would use them. And this ride was no exception.

Climbing up, the 1200/16i Proton Extreme at the rear felt confident inspiring, especially in the corners. The tyre has a slightly softer compound – something you notice when riding over uneven patches – but that softness is a plus when you're carrying some pace. Instead of the jarring that you'd expect on sharp bumps, the impact feels well-managed, without that uncomfortable kick through the bars.

The real test came on the descent from Kodaikanal. The clouds decided to part ways with mist, and we found ourselves in a proper downpour. Add to that, some of the test bikes were clearly in need of a brake service, making things a bit sketchy. But even in the wet, the tyres held up commendably. Braking distances remained consistent, and cornering grip didn't wobble out – a testament to the compound tuning and tread design Eurogrip has done for Indian weather.

I did notice a unique characteristic on the Xtrime on the way down: the front end felt noticeably heavier at low speeds. This is more a result of the tyre's construction than a flaw, but it's worth mentioning. The Xtrime 1200 has a light front end, and with the Dualwall E80 up front, it did feel a bit weighted while manoeuvring through traffic or tight village turns. It's not a dealbreaker, but if you're used to a faster front end, it'll take a short adjustment period.

The ATT 1200 rear, on the other hand, was composed and grippy throughout the ride. Whether we were accelerating out of sweeping corners or dealing with gravel and debris in the lower-altitude sections, the rear end tracked faithfully. Together, the E80 and ATT 1200 form a well-balanced pairing that gives you a good mix of stability and agility – a combo that makes sense for India's unpredictable road conditions.

By the time we rolled back into the plains, wet boots and all, the tyres had made a solid impression. For everyday riders who need tyres that can confidently handle long highway runs, poorly maintained inner roads, and even the odd mountain getaway, the ATT 1200/16i Proton Extreme as well as the Dualwall E80/ATT 1200 combo tick most of the right boxes.

The latter may not make your bike feel race-prepped or featherweight, but they'll get you there – comfortably, confidently, and most importantly, safely. 🛤️

TESTING TYRES AT EUROGRIP TREAD TALKS

Eurogrip Tyres invited us for a tour of the tyre manufacturing and R&D process at the company's Srichakra plant in Madurai, followed by a nearly 300-kilometre-long test-ride to Kodaikanal and back

Story: **Abhisu Poddar** Photography: **Kalidas M**

EUROGRIP TYRES TAKES ITS COMMITMENT TO rubber very seriously. With a formidable portfolio of two-wheeler and three-wheeler tyres for customers to choose from, the TVS Group subsidiary leaves no stone unturned: from scooters and commuters to sport bikes and sport-tourers, almost every type of rider will find an offering that suits their needs. In fact, Eurogrip is currently prototyping super-sport tyres, starting with a racing slick tread design which will be supplied to racing teams as an original equipment manufacturer (OEM) option. Superbike owners may find road-compatible versions of the same in store soon.

After a highly enriching tour of the company's plant and R&D facility, Eurogrip introduced us to a wide range of sub-400-cc bikes shod with its range of rubber, and sent us off on our way to get a taste of what they have to offer.

Riding the first stint on a Royal Enfield Hunter 350, shod with a 100/80-17 Beamer HS+ at the front and a 120/80-17 Sporteq CR at the rear, the first 75 km comprised traversing village roads, congested markets, and four-lane highways. The rubber pairing, though odd, performed well, ably tackling crudely made speed humps, potholes, and terrible patches of (no) asphalt. On the four-lane highway, a bunch of triple-carrying joyriders suddenly decided to cut across in front of me, and the Beamer HS+ did a good job of handling that high-speed hand-braking encounter.

Just before we began the 6-km-long winding hill climb, I was reallocated a Royal Enfield Classic 350, again sporting a unique tyre configuration: a 90/50-19 Terrabite DB+ at the front and a 120/80-18 Terrabite DB+ at the rear. One wouldn't consider an off-road biased tyre to be a good option on a road surface where tarmac grip is paramount. However, the Terrabites performed impressively, the block-pattern tyres happily adhering to the blacktop as the pegs scraped away on the mountainous sweepers till we reached our stop for the night.

It was the next morning that I got to truly explore the potential promised by Eurogrip's sportier range of products. On the way down from Kodaikanal, we were greeted by a torrential downpour that would put any tyre to an exacting test. Aside a Suzuki Gixxer 155, shod with a 100/80-17 AT1625 at the front and a 140/60 R17 Protorg Extreme at the rear, I started off slowly, warming up

a feel for the tyres' behaviour in those extreme conditions. After a few kilometres, however, I found myself attacking the curves at full pelt, without an ounce of hesitation about the tyres' wet-grip limits. In fact, the water dissipation felt so efficient that I started braking much later and harder into the corners, fully utilising the tyres' contact patch as I leaned further and further on the beautifully carved Kodaikanal Ghat roads.

Throughout this nearly 300-km ride, the diverse range of Eurogrip's tyres provided plentiful grip, inspiring confidence all the while. Each product lives up to its claims, and despite the odd tyre pairing on some of the bikes, the ride experience was never hindered.

Eurogrip continues to impress with its constant innovation and dedication to providing the customer with the best quality of rubber for their rides, and we are now looking forward to what more they have in store.

EXPERIENCE EUROGRIP TREAD TALKS 2025

RUBBER CHRONICLES

A lesson on how much of a motorcycle's story is really written by its tyres

By Yash Sunil Photographs Eurogrip

110 MOTORING WORLD | SEPTEMBER 2025

In a world where displacement, power and torque numbers hog the spotlight, the most crucial piece of the puzzle usually slips under the radar — tyres. Think about it, that tiny patch of rubber, not much bigger than an A4 sheet, is all that connects you and your motorcycle to the road. Yet it dictates how much of that performance you actually get to enjoy.

Over the years of riding different bikes, I've never really taken the time to think about tyres in detail. What goes into the rubber mix? How do they come up with tread patterns? Why do some use steel belts and others nylon? The more you think about it, the more questions you end up with. And for me, that curiosity has always been there, because tyres are the only real connection we have with the road.

So when the invite came to attend the ninth edition of Eurogrip Tread Talks, an event where journalists get to watch tyres being born and then flag them in the real world, I was all in. For me, it wasn't just about the factory tour; it was also the perfect excuse to dust off my riding gear and head out on a motorcycle trip after what felt like forever.

But before I could swing a leg over the bike, our first stop was Eurogrip's factory in Madurai. Walking through those gates felt less like stepping into an industrial setup and more like sneaking behind the curtain at a magic show. From

raw sheets of rubber to gleaming finished tyres, the process was equal parts meticulous and mesmerising. And here's the kicker, Eurogrip isn't just making tyres for India. Their products roll into Indonesia, Thailand, Colombia, and soon, the American market, too, with tyres tailor-made for cruisers like Harley-Davidson and Indian Motorcycle.

Out of everything inside the factory, it was the R&D facility that really knocked me sideways. Sivaramakrishnan V, Eurogrip's CTO, casually mentioned that they can strip down any tyre to its molecular and analyse every single detail before it even hits production. And just when I thought I'd seen it all, Eurogrip rolled out some eye candy, a set of racing slicks for superbikes. These are headed to the TVS India One Make Championship, with a market launch targeted for 2027 to take on the mighty Pirelli Supercorsa SP V4. On the safer side of things, they also showed off the Roadhound, their entry-level big-bike tyre, now available in its widest 190-section.

With the briefing done, it was finally time to ride. A line of motorcycles stood waiting, each one kitted with Eurogrip's freshest rubber. I started off on the Hero Xtreme 160R, running AT120s at the front and ProTorq Extremes at the rear. Day two, I switched to the Bajaj Dominar 400, this time with ProTorqs at both ends. The fleet

SEPTEMBER 2025 | MOTORING WORLD 111

“With the tyres gripping like glue, I ended up pushing harder and wringing out every bit of performance”

112 MOTORING WORLD | SEPTEMBER 2025

was a mixed bag — light, sporty commuters like the Yamaha FZ-S, Suzuki Gixxer 150, Hero Xtreme 125R, and for those who prefer a dash of old-school, the Royal Enfield Classic 350.

The ride plan was just right — a 200-km stretch from Madurai up to Kodaikanal. Famously enough, I'd driven up those same twisties a few months ago in a car, but two wheels changed the game entirely. The route had everything, snaking bends, surprise rain showers, and a steady climb in altitude. In short, the perfect playground to see what a set of tyres is really made of.

The ride up to Kodaikanal itself was largely uneventful, but the tyres shone, letting me attack corners and skim over rough patches with confidence. The only hiccup was the Xtreme 160R, which developed a stubborn clutch issue that robbed me of some fun. Still, I wasn't about to sulk. With the tyres gripping

Taking a moment to enjoy the scenic views of Kodaikanal

The complete range of Eurogrip tires

like glue, I ended up pushing harder and wringing out every bit of performance the bike still had to give.

For the return leg the next morning, my plan was simple: get a proper feel of the ProTorq Extremes I'd been hearing so much about. But the weather gods clearly had a sense of humour. The moment we rolled out of Kodaikanal, the skies opened up and I was riding through a torrential downpour... with zero rain

gear. Within minutes, I was soaked to the bone, half cursing myself and half wondering if Eurogrip also makes waterproof jackets.

If there was ever a way to test tyres, though, this was it. And to their credit, the ProTorqs didn't flinch. Through puddles, slick roads, and blind bends, they just gripped and carried on. Even as one of the greener riders in the group, I kept pace without once feeling sketchy — and honestly, that kind

of reassurance in the wet is worth its weight in gold.

By the time the tour wrapped up, I had a newfound respect for tyres. They've always been the last thing I've looked at when testing a vehicle, but a day inside the factory and nearly 400 km on the road drove the point home. All the power and torque numbers in the world mean nothing if you don't have good rubber underneath. Without it, everything else is just brochure talk. ■

Made In India Superbike Tyre Brand Coming Soon: All You Need To Know

Authored by: Shivani Sharma | Updated Aug 25, 2025, 11:32 IST

Eurogrip, the tyre brand from TVS Srichakra, will launch its first superbike tyre in India by 2027. Designed at its Milan, Italy R&D center and manufactured in India, the tyre will feature Quadrazone Tech and a road-legal tread pattern, making it suitable for both everyday riding and high-performance use.

It is imperative to understand the importance of tyres. Connecting you and your machine to the surface, tyres may seem mundane to most, while holding one of the most complex engineering processes. They have to grip under multiple conditions, endure massive physical stress, and piggyback all the electronic aids to make the motorcycle perform at its best always. To delve a bit further into the engineering, Eurogrip invited us to its manufacturing plant in Madurai to understand its technology and also to experience it on real roads. The ride was planned from the factory gates to the misty hills of Kodaikanal, taking us through city traffic, open highways, and finally tight mountain roads. The return leg added another dimension with steady rain, allowing us to push the tyres in conditions where grip really matters.

STEPPING IT UP

EuroGrip wanted us to check out its ProTorq Extreme HR range and we obliged

The tyres on your motorcycle are as important as its specs, maybe more, as there is nothing else connecting you to the road except two contact patches the size of a moon jar lid. It's a bit like your shoes—get the wrong pair, and you will hate the ride; get the right pair, and the whole experience elevates itself.

EuroGrip wanted us to test what its tyres are capable of, so they planned a ride from Madurai to Kodakulam. From the heat and chaos of the temple city to the cool, twisty roads of the princess of hills, it was just the perfect mix of roads.

We started the trip on a Yamaha MT45 with a Basmor HS+ at the front and a ProTorq Extreme at the rear. Through the city, those felt steady and smooth, which is what you want in traffic. The braking was predictable and the grip levels were strong even when I had to dodge sudden surprises.

After a quick break I swapped to a Rajaj Dominar

[FEATURE]

400 running ProTorq Extreme HR at both ends. On the way up to Kodakulam, the grip was excellent. The tyres warmed up quickly, delivering the confidence to lean harder through the corners. By the time we reached the top, I was grinning like a kid, throwing the bike side-to-side through the bends and enjoying every moment of it.

The next morning, the weather turned rainy, and on the hills, that usually means slowing down for the decent, but not this time. The ProTorq Extreme HR Tyres felt planted even on wet tarmac. The braking, cornering and the stability were not compromised due to the wet tarmac.

By the time we rolled back into Madurai, the conclusion was clear: EuroGrip has stepped up big time. Their tyres feel sorted in the dry, dependable in the wet and are built to last that's what they claim, we would be happy to do some long-term testing, if you are thinking of getting your stock tyres swapped, both the Basmor HS+ and ProTorq Extreme make great alternatives for everyday use and performance.

Indian manufacturers have come a long way when it comes to tyre technology and EuroGrip's tyres are a testament to that fact. EuroGrip is also in the process of developing racing slicks, which we will get to see soon; however, they will be exclusively available for racing use only. **EC**

ABOVE: Slick tyres are currently under development by EuroGrip and would be available later for track use only.
