

We're excited to share the feedback of **Sonny Goggia**, one of the top Hard Enduro riders in the world and a former European Champion, who recently put our **CLIMBER XC-R** in its **SUPERSOFT** compound to the test—both during personal training sessions and at the **HarDragon**, an extreme enduro event held in the *Modena (Italy)* region on June 21–22, 2025.

Known for its technically demanding terrain, the *HarDragon* challenged riders with river crossings, steep dirt climbs, and dry rocky sections—an ideal proving ground for our most aggressive enduro tyre.

Riding a **KTM 300 2-Stroke**, *Sonny* faced the *HarDragon*'s notoriously demanding terrain, which included slippery riverbeds, steep dirt climbs, and dry rocky sections—an ideal proving ground for our most aggressive enduro tyre.

Here's what *Sonny* had to say:

- /// A nice surprise. Tried in slippery rivers—really good grip.
- /// The very soft carcass helps the tyre conform to the terrain, offering solid traction in every situation.
- /// Felt great on dirt climbs—probably thanks to the very aggressive tread design.

His overall impression:

- /// A very balanced tyre that works well on dirt, riverbeds, or dry rocks. All in all, an excellent compromise.

TESTING CONDITIONS

LOCATION

Emilia-Romagna, Italy

TEST VEHICLE

KTM 300 2-Stroke

PERIOD

June 2025

CONCLUSION

This feedback reinforces what the **CLIMBER XC-R SUPERSOFT** was built for: maximum traction and support for the most extreme Hard Enduro conditions. Its super-soft compound and high-traction tread pattern give riders the confidence and control needed when the trail turns brutal.

ABOUT CLIMBER XC-R

Climber XC-R tyres were designed by Eurogrip's Italian R&D Center in Milan. Produced in India, they undergo rigorous testing on different types of terrain and weather conditions.

This tyre complies with **FIM** Enduro rules and is ideal for those who want to challenge others and themselves. To be combined with the front **CLIMBER XC**, it is available in 3 variants (Medium, Soft and Supersoft) depending on the terrain.

MAIN FEATURES:

- Newly developed compounds, finely tuned in all their parameters to match and exceed their intended use
- Synthetic fibers x-ply structure with modular stiffness improving support when leaning and shifting weights between wheels
- Knobs layout and shape enhancing off-road traction when leaning, braking and accelerating, all within FIM parameters
- Knobs symmetrical geometry allows reversing the tyre when a side is worn, increasing its durability
